

ErrorLogs DigitExtractor and Num

DigitExtractor

```
10 System.out.print("Enter an integer: ");
11 int userInput = scanner.nextInt();
12
```

I forgot to use my semi colon function at the end of my line of code, as a result an error was prompted and I quickly resolved the issue.

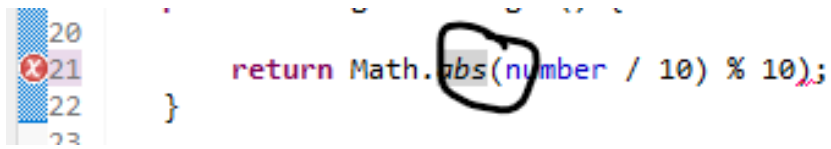

```
37 System.out.println("The whole number is: " + num.getNumber());
38 break;
39
40 case 'd':
41     System.out.println("The ones place digit is: " + num.getOnesDigit());
42     break;
43
44 case 't':
45     System.out.println("The tens place digit is: " + num.getTensDigit());
```

An error was prompted in line 40 this snippet. I analyzed and figured out that there was a small mistake of not adding the colon function to mark the end of my case declared.

```
14 Num num = new Num(userInput);
15 Char choice;
```

An error was prompted here under the char since there was a capital C instead of a lowercase c. I solved the problem by adding a lowercase c instead of an uppercase C.

Num

```
20  
21 return Math.abs(number / 10) % 10;  
22 }  
23
```

An error was prompted here, as i analyzed the line of code i realized that there must be another bracket after abs to fully close the other bracket and complete the line of code.
